

Bellurgan FC

2025/26 Performance Analysis

Full league results • Veo performance data • current league table

Coach and player chart pack

Executive summary

What the data says before moving into individual charts

RESULTS

Clear improvement in form

Bellurigan have 14 points from 15 league games. Results improved from 0.50 points per game in the early fixtures to 1.43 in the latest group.

PERFORMANCE

Better possession, but not territory

Veo data shows possession increased to 51.6%, yet attacking-third possession remains around 20%. More possession is not yet translating into sustained pressure.

RUN-IN

Top-three test to finish

The final three opponents average 2.13 points per game. In previous meetings with them, Bellurigan took 0 points, scoring 1 and conceding 9.

Results: evidence of improvement

Full league results are used for the outcome story.

- 01** The season record is 14 points from 15 league matches, equal to 0.93 points per game.
- 02** The latest group is materially stronger than the early group: 1.43 PPG versus 0.50 PPG.
- 03** This means the results story and the Veo performance story broadly point in the same direction.

League results across the season

All 15 league results to date

Later form is stronger

The timeline shows a difficult start followed by a more competitive run. Results remain inconsistent, but the latest stretch contains more wins and draws.

Five-game rolling league form

Points per game across each rolling five-match period

Form improved late

Rolling five-game points per game rises above the season average in the later period. This supports the view that the team has improved rather than only having isolated results.

Early versus latest league results

All league results, not only Veo-recorded games

Points improved sharply

Points per game increased from 0.50 to 1.43. Goals conceded reduced, while scoring changed only slightly, suggesting that improved competitiveness is partly defensive.

League fixture sequence

Home and away distribution across the season

League fixture sequence

Home and away distribution across the season

The sequence highlights consecutive home and away fixture blocks.

Fixture balance is uneven

The sequence includes four consecutive away league fixtures followed by four consecutive home fixtures. This is useful evidence for a fixture-balance discussion, not proof of causation.

Consecutive away and home fixture blocks

Longest away run compared with the following home run

Consecutive away and home fixture blocks

Descriptive comparison of the longest away run and the following home run

The comparison does not establish that venue caused the performance difference.

Away block was weaker

Bellurgan averaged 0.75 PPG in the away block and 1.75 PPG in the following home block. Opposition strength differed, so this should be framed descriptively.

Home versus away league results

All 15 league results to date

Home versus away league results

All 15 league results to date

Home edge exists, but is modest

Home points per game is slightly higher and the away loss rate is higher. However, goals conceded per game is not worse away, so the evidence is mixed rather than decisive.

Veo performance: process measures

Recorded matches explain how performances are changing.

- 01** Possession increased from 43.8% to 51.6% in the Veo sample.
- 02** Shot share improved strongly, but attacking-third possession stayed near 20%.
- 03** The central question is now whether possession can become territory and pressure.

Early versus latest Veo performance

Comparison of the available performance-data sample

Early versus latest Veo performance

Comparison of the available performance-data sample

Better process, similar territory

Possession, shot share and shots for improved, while shots against reduced. Attacking-third possession remained flat, so the next step is progression.

Shot share by league match

Bellurgan share of all attempts in Veo-recorded matches

Shot share by league match

Bellurgan share of all attempts in Veo-recorded matches

50% indicates an equal number of attempts.

Shot share is improving

Bellurgan are below 50% in many matches, but the latest games show movement towards parity. Sustaining this against stronger opponents is the next test.

Shots for and against

Red = Bellurgan | Black = opposition

Shot suppression is coachable Opponents frequently generate more attempts. A practical target is to keep opposition shots closer to 10–11 while maintaining Bellurgan’s recent shot output.

Possession and territorial profile

Overall possession by Veo-recorded league match

Possession is not territory

Bellurgan often have meaningful possession without spending enough of it in the attacking third. Around 81% of passes are in the middle third.

Does possession translate into attacking territory?

Overall possession compared with attacking-third possession

Does possession translate into attacking territory?

Overall possession compared with attacking-third possession

More ball does not always mean more threat

Some matches show high possession without high attacking-third possession. This supports a focus on progression and field position, not possession percentage alone.

What do Bellurgan wins look like?

Performance metrics from Veo-recorded league matches

What do Bellurgan wins look like?

Performance metrics from Veo-recorded league matches

Small samples should be interpreted descriptively.

Wins are efficient games

Wins are associated with lower shots against and much higher conversion, not simply more possession. Reducing chances conceded is the repeatable lever.

Which Veo metrics relate most to points?

Small-sample correlations: descriptive indicators only

Correlation with match points

Interpretation

Goal conversion has the strongest relationship with points in the current sample. Possession and completed passes alone do not explain results, so treat them as process metrics rather than winning predictors.

Rock vs Bellurgan Analysis Sep '26

- Rest Defence
- Goal scored

Rest-defence case study

Video evidence explaining how turnovers became high-risk moments

TACTICAL ISSUE

Rest defence is exposed before the turnover

1. Too many players are ahead of or level with the ball when the attack breaks down.
2. The supporting line underneath the ball is thin, leaving space for the first transition pass.
3. The defence is stretched vertically, so the nearest counter-press does not have enough cover behind it.

Coaching focus: keep a 2+2 or 3+1 structure behind the ball, with one midfielder underneath the attack to provide both a recycle option and protection if possession is lost.

Video-to-data link

This clip explains why possession and shot-share charts need tactical context. Bellurigan can have numbers in attack, but if the rest-defence is not balanced, one turnover can become a high-quality opposition chance.

Rest defence case study: second goal conceded

The free kick is the final event, but the structural issue starts earlier when the attack breaks down.

Key message

Similar pattern to the first goal: numbers are committed around the ball, but cover behind it is stretched.

When the duel is lost, Rock can attack the central space and we are forced into recovery defending.

The lesson is not just “avoid fouls”; it is to protect the attack better before the transition happens.

Positive example: first goal scored

Keep this slide as a balance to the rest-defence examples; insert the goal video manually if needed.

Positive takeaways

Good starting shape, make them go long.

Win the header, get second ball.

Quick forward progression once space opens.

Good width and depth stretch the back line and create space, excellent pass and run.

Positive attacking intent: attack space early.

League context and run-in

The final three fixtures are against strong current opposition.

- 01** Parkvilla, Trim and Duleek average 2.13 points per game compared with Bellurgan's 0.93.
- 02** They score more frequently and concede less frequently than Bellurgan.
- 03** In the previous meetings with these teams, Bellurgan lost all three by an aggregate 9-1.

League attacking and defensive profile

Bellurgan and the remaining three opponents highlighted

Gap exists at both ends

Bellurgan sit in the weaker attack and weaker defence quadrant. The remaining opponents are positioned in the stronger league-performance area.

League goal difference per game

Bellurgan compared with the current league

League goal difference per game

Bellurgan compared with the current league

Goal difference shows the run-in challenge Bellurgan are at -0.80 goals per game. The final three opponents are all positive, making the closing games a strong test of recent progress.

Final three league opponents

Bellurgan compared with Parkvilla, Trim and Duleek

Top-three strength profile

All three opponents outperform Bellurgan on points per game, scoring rate and concession rate. The priority should be controlling chances and territory first.

Previous meetings with the final three

Duleek, Parkvilla and Trim

Previous meetings were difficult

Bellurgan took 0 points from the first meetings, scoring 1 and conceding 9. The run-in is a direct test of whether recent improvement is real.

Coaching priorities from the analysis

A practical interpretation of the evidence

1. CONTROL

Reduce opposition shots

The most repeatable target is suppressing opposition attempts. Wins occur when shots against are lower, while relying on high conversion is less sustainable.

2. PROGRESS

Turn possession into territory

Possession and passing have improved, but attacking-third possession has not. Work should focus on moving the ball higher and sustaining pressure.

3. TEST

Use the final three as a benchmark

Parkvilla, Trim and Duleek provide a clear test against strong opponents. Judge performances through shot differential, territory and defensive control, not scoreline alone.
